

E-Commerce Sales Data Analysis

Project Overview

This project explores an e-commerce sales dataset to uncover meaningful insights into customer purchasing behavior, order performance, and revenue trends. The dataset was cleaned and prepared for analysis to support data-driven business decision-making.

Business Problem

E-commerce businesses generate large volumes of transactional data every day. Without proper analysis, it becomes difficult to identify sales trends, customer preferences, payment patterns, and operational challenges. This project aims to transform raw sales data into actionable business insights.

Project Objectives

- Clean and prepare the sales dataset for analysis.
- Analyze customer purchasing patterns.
- Evaluate product sales performance.
- Examine payment method preferences.
- Identify order status trends.
- Generate insights that can improve business decisions.

Dataset Description

The dataset contains transactional information including Order ID, Order Date, Customer ID, Product, Quantity, Unit Price, Total Price, Payment Method, Order Status, Shipping Address, Tracking Number, Coupon Code, Referral Source, and Items in Cart.

Tools Used

Microsoft Excel, Data Cleaning, Data Analysis.

Data Cleaning Process

Reviewed the dataset, standardized formats, ensured data quality, and prepared it for analysis.

Key Analysis Areas

Sales performance, product demand, customer purchasing behavior, payment methods, order fulfillment, and revenue analysis.

Expected Business Insights

Understand top-performing products, preferred payment methods, order completion trends, revenue performance, and support strategic business decisions.
